01 Problem–Solution Fit (Canvas Based)

The Problem-Solution Fit Canvas provides a structured, evidence-based mapping of stakeholder pain points to the targeted capabilities of FitHub CRM. Each quadrant is derived from direct user research and operational observation.

Customer Segments

- Gym Owners / Managers
- Certified Fitness Trainers
- Active Gym Members / Customers

Jobs-To-Be-Done / Problems

- Manage member lifecycles efficiently
- Schedule and oversee class timetables
- Book classes without friction or errors
- Receive timely notifications & reminders
- Access operational analytics on-demand

Customer Constraints

- Limited technical expertise in small gyms
- Budget constraints for enterprise software
- Resistance to change from manual habits
- Lack of dedicated IT support staff

Available Solutions (Existing)

- Paper registers and manual ledgers
- Excel/Google Sheets for tracking
- WhatsApp groups for communication
- Generic booking apps (limited backend)

Problem Root Causes

- No single source of truth for member data
- Manual booking prone to double-entry errors
- Communication is informal and inconsistent
- Zero automation for reminders or follow-ups
- No analytical visibility for decision-making

Behaviour (Current Actions)

- Owners maintain multiple spreadsheets
- Trainers rely on paper schedules
- Members call/WhatsApp to book classes
- Staff manually send reminder messages

Triggers (What Causes Action)

Emotions

Channels

• Double-booking incidents at peak hours • Missed class notifications → member complaints • Year-end reporting reveals operational gaps • Competitors adopting digital platforms	• BEFORE: Frustrated, overwhelmed, time-poor • BEFORE: Anxious about errors and missed data • AFTER: Confident, in control, data-driven • AFTER: Satisfied with seamless automation	• Online: Salesforce Lightning Web interface • Email: Automated Flow-based notifications • In-App: Dashboards and real-time reports • Offline: Admin staff input at front desk

Your Solution — FitHub CRM

FitHub CRM is a cloud-native Salesforce application that centralizes member data, automates class scheduling and booking, delivers real-time notifications via Flow automation, and surfaces actionable business intelligence through configurable dashboards. It directly addresses every pain point identified in the canvas above — transforming manual, error-prone operations into an intelligent, scalable, and user-centric fitness management platform.

02 Proposed Solution

Overview

FitHub CRM is a purpose-built, cloud-based Salesforce application architected to digitally transform the operational backbone of modern fitness centers. By leveraging Salesforce's declarative development capabilities — including custom objects, Flow automation, Lightning UI, and native reporting — FitHub CRM delivers a unified platform that manages member lifecycles, optimises class scheduling, streamlines bookings, and generates real-time business intelligence. The system is designed for operational simplicity, academic rigour, and enterprise-grade reliability.

Design Philosophy: Every feature directly maps to a validated user pain point identified in the Problem-Solution Fit Canvas. No feature exists without a corresponding business justification.

Key Features

F1

Member Management

A dedicated custom object stores comprehensive member profiles including personal details, membership tier, attendance history, and payment records. Admins can create, update, deactivate, and search member records through a purpose-built Lightning page. Automated validation rules enforce data integrity, while duplicate management rules prevent redundant entries.

Solves: Eliminates manual spreadsheet tracking; provides a single, authoritative source of member truth.

F2

Class Scheduling

Trainers and administrators manage class timetables through the Trainer and Class custom objects. Each class record captures capacity, schedule, assigned trainer, and status. Lightning list views and calendar components provide at-a-glance scheduling visibility, preventing double-assignments and capacity overflows.

Solves: Replaces paper schedules; eliminates scheduling conflicts with automated capacity enforcement.

F3

Booking System

The Booking custom object establishes a many-to-one relationship between members and classes. Members or staff can create booking records, with validation rules preventing overbooking beyond class capacity. Booking status fields (Confirmed, Cancelled, Waitlisted) provide a real-time operational picture.

Solves: Removes manual booking registers; enforces capacity rules automatically and transparently.

F4

Automation — Email Alerts via Flow

Salesforce Flow (Record-Triggered) automates email notifications for booking confirmations, class reminders (24 hours prior), cancellation alerts, and membership renewal notices. No manual communication effort is required from staff. Flow logic handles conditional branching — e.g., sending waitlist notifications when a cancellation frees a slot.

Solves: Eliminates missed notifications; frees admin staff from manual communication workflows entirely.

F5

Reports & Dashboards

Pre-configured Salesforce Reports and Dashboards surface KPIs including member retention rates, class attendance trends, booking conversion ratios, and revenue summaries. Role-based dashboard access ensures gym owners see strategic metrics while trainers view only their class data. Scheduled report delivery provides periodic insights without manual extraction.

Solves: Provides data-driven decision support that was entirely absent in manual systems.

Why Salesforce CRM?

Factor	Justification for FitHub CRM
Cloud-Native Platform	No infrastructure investment; accessible from any browser or device.
Declarative Configuration	80% of the system is built via point-and-click — minimal custom code required.
Built-in Security	Enterprise-grade role hierarchy, profiles, and field-level security out of the box.
Flow Automation	Powerful no-code automation engine replaces manual workflows and notifications.
Scalability	Handles growth from 100 to 10,000+ members without architectural changes.

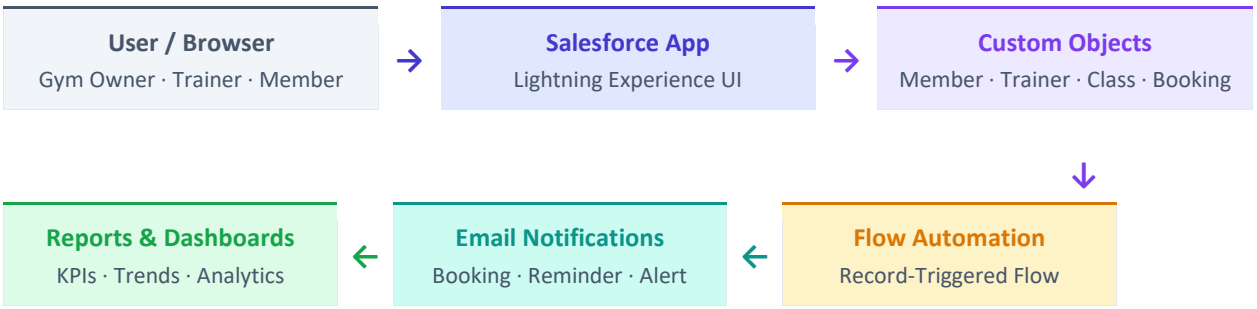
Ecosystem & Support	Trailhead learning, AppExchange integrations, and global community support.

03 Solution Architecture

The FitHub CRM architecture is built entirely on the Salesforce Platform, leveraging its declarative and programmatic capabilities to deliver a robust, secure, and maintainable system. The architecture follows a layered pattern — presentation, logic, data, and security — with each layer clearly separated and independently configurable.

System Architecture Diagram

The following diagram illustrates the end-to-end component flow of FitHub CRM:



Read as: User → Salesforce App → Custom Objects → Flow Automation → Email Notifications, and back up through Reports & Dashboards.

System Components

Salesforce Platform	Cloud infrastructure; Lightning Experience UI; governor limits enforce best practices.
Custom Objects	Member, Trainer, Class, Booking — each with tailored fields, validation rules, and page layouts.
Flow Automation	Record-Triggered Flows handle booking confirmations, reminders, cancellations, and escalations.
Reports & Dashboards	Pre-built and custom reports; role-specific dashboards with scheduled delivery.
Email Templates	Branded HTML email templates invoked by Flow for all automated communications.
Security Layer	Profiles, Role Hierarchy, FLS, and Sharing Rules enforce least-privilege access.

Data Flow

The following sequence describes how data propagates through the FitHub CRM system from initiation to insight:

01	Member record created/updated in Salesforce
02	Member selects and books an available Class
03	Booking record links Member ↔ Class object
04	Flow Trigger fires on Booking creation event
05	Automated email dispatched to Member's inbox
06	Transaction logged; Reports & Dashboards update in real-time

Integration (Optional Enhancement): Future iterations may integrate a Payment Gateway (e.g., Stripe via Salesforce Connector) for in-app membership billing, and a WhatsApp API for real-time chat notifications — extending FitHub CRM beyond its current scope.

Security Layer

FitHub CRM implements a comprehensive, multi-tier security model aligned with Salesforce best practices and the principle of least privilege:

Profiles	Admin, Trainer, Staff — define CRUD permissions per object
Role Hierarchy	Managers inherit visibility over subordinate records
Field-Level Security	Sensitive fields (e.g., payment info) hidden from Trainers
Record-Level Access	Sharing rules ensure members see only their own bookings
Audit Trail	All data modifications are tracked with user timestamp logs

Next Phase: Development & Configuration

With the Problem-Solution Fit validated, the solution architecture designed, and all components specified, the project advances to the Salesforce configuration phase — covering object setup, Flow build, Lightning page design, and UAT planning.
